

Smart Flood Protection

The water probe will alert you to flooding in your home or business. The wireless water sensor is a great solution for protecting basements, kitchens, laundry rooms, bathrooms, water heaters and/or sump pumps from damage from flooding or water leaks. Broken hoses, burst pipes or faulty appliances can cause catastrophic damage to your home if a water leak goes unnoticed. Not only can the water sensor help you avoid expensive structural damage, but by detecting the water leak as soon as it happens, you can also prevent dangerous health risks from the resulting mold after a flood.

Based on a recent study by the Insurance Research Council, 60% of property claims are caused by faulty indoor appliances or plumbing leaks, 25% are caused by rain or flooding and 11% are caused by sewers and sump pumps. Why not maximize your security system by adding environmental protection?

The remote water probe will trigger an alarm when both pins are in contact with 1/4" of water for (3) minutes. The water sensor will restore the alarm after no water is in contact with the probe for another (3) minutes.

The key to protection is effective detection
Proper warning and intervention can literally make the difference. Your sensors will be monitored around-the-clock so that your property is protected even when your system is disarmed.
