

## Smart CO Protection

Carbon monoxide is a silent killer that is undetectable to us through smell, taste or sight. A Wireless Carbon Monoxide Detector from Forest Security is your solution for safeguarding your home against this hazardous gas. The detector is powered by a 3V CR123A lithium battery allowing it to work wirelessly. This feature provides flexibility to the user to place it where ever they want in a home and not have to be constrained by AC outlets or hardwiring.

Upon detection of carbon monoxide this detector will emit an 85 decibel alarm and communicate the event to the Control Panel. The carbon monoxide detector will also send tamper and battery condition messages to the panel. The detector also features three LEDs to provide visual confirmation of the devices' status. The LEDs will flash "green" when it is functioning on normal status, "yellow" when the battery is running low or the detector is in trouble, and "red" if being tested or if there is an alarm.

The key to protection is effective detection  
 Proper warning and intervention can literally make the difference  
 between life and death. Your sensors will be monitored around-the-clock  
 so that your family is protected even when your system is disarmed.
